Tell

Do you wish help in reading very young trees the variety of which you doubt?

Do you have troubles of your own? If so write about them fully and freely and mail to us with stamp and wait our reply, we may be able to

How many and what probable varieties of trees will you plant next season?

Give name and address today of any one you have learned is about to plant

A Good time to plant fruit trees is in the Fall, not too early, about 15th to the 30th of November. Plant in the Spring just as soon as frost is out of the ground. Trees planted from February 1st to March 10th will always do well.

Summer Pruning

Do not prune trees in Summer during the first three years. While you are cutting off limbs you are depriving the tree of leaves. The leaves are the lungs and stomach of the tree. You will check the growth of the root and top and hence injure the tree.

There are TREES and TREES just as there are COWS and COWS. Heredity prevails in plants as in animals. All now agree on this. So it is only a question of getting Buds and Scions. Select and mark while fruit is on tree. Spare neither time nor money but

GET THE BEST

for the nursery just as up-to-date orchardists have always practiced.

Do you get the idea?

Get a high class of stock at regular prices. No agents.

Send a List of your wants today direct to the Y-S Nursery.

"By their fruits ge shall know them" but by their leaves ye may know them

SPITZENBERG COMMON WINESAP

JONATHAN STAYMAN WINESAP

This leaf with its dull edge on light wood is a Spitzenberg.

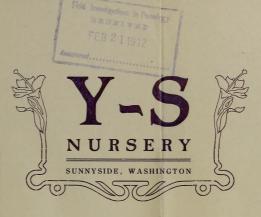

Very much the same leaf on ark wood marks the Common dark woo Winesap.

This leaf with its sharp edge on light wood is a Jonathan.

Very much the same leaf on dark wood marks the Stayman Winesap

These four popular varieties are constantly getting mixed.

There are other marks of distinction on varieties and this is only to give a hint at the study.

A FEW FACTS THAT ARE FACTS

'Y-S is for Yakima-Sunnyside, the nursery at Sunnyside, Washington, that DOES THINGS. This ranks as "a small nursery" but planted 400,000 trees in 1910, 700,000 in 1911. More can be done and maintain the rigid operating system of this plant.

This bulletin in three parts tells how better than ordinary results are secured by the V-S.

PART I. BETTER STOCK

is secured by carrying out rigidly the following rules.

- 1. Upon the strongest one-year-old CLEAN roots and trees set a similarly strong, CLEAN scion or bud PERFECTLY MATED and JOINED.
- 2. Having secured the ground that has grown a maximum yield of alfalfa, after perfect tilth, plant the trees very early in the long Sunnyside season.
 - 3. Irrigate, but especially cultivate "to beat the band."
- 4. Trees are thoroughly ripened. The heeling-in beds are the fine Sunnyside sand, last to freeze and first to thaw. Roots are never exposed in transportation. The packing for shipment is by experts and trees are guaranteed to arrive in good condition, in proper time for planting, at any destination.

This is how Sunnyside trees "beat the world for a one-year-old

PART II.

FIVE BETTER LABELING RULES

- 1. Mark trees selected for propagating stock while fruit is on with a permanent label, numbered.
- 2. Bunch scion or bud sticks before leaving this tree, giving same this trees labeled number.
- 3. Introduce a system into your grafting and planting that will get this stock into your nursery row with similar labels.
- 4. Every nurseryman should know the commercial trees he grows from leaf and bark and in fall while leaves are still on, check up every tree in every row.
- 5. Check up everything by getting the best man to do the work and then get another competent man to see that everything is O. K.'d before leaving the nursery. You are "doing it all yourself" when you see to it that these five rules are rigidly enforced and it must be the business of one man; the manager, to see to this.

This is how the Y-S can afford to go behind their trees with an indemnity bond.

However, stick a pin here in this:

NOTE-The policy of the Y-S nursery is to teach their customers how to know themselves and if they do not have time or care to know, the importance of getting the man who does know to check up and see to it that the trees they are buying are as represented in every particular. Also to inspect or have inspected every tree and see to it that it is CLEAN, and when the leaves are mature during the first season make sure of their variety. This is not an easy task but it is possible and is the only way to lay the foundation for so great and valuable a thing as a first-class commercial orchard.

PART III. BETTER FRUIT

The Y-S nursery agrees with the most up-to-date orchardist, with the Professors and the Federal Government experts, that the bud transmitted under similar conditions and environments as a fixed rule does not change so that the most regularly bearing trees of the finest fruit reproduce themselves much more certainly than do superior animals in breeding and therefore for BETTER FRUIT, follow these four rules to secure propagating stock.

- 1. This nursery goes to prize winning or record making orchards, 2. They select trees bearing not less than three successive prior
- NOTE-A. D. Shamel, Federal Government Expert, with other

professors, agree with opinion of the best orchardists that the heavy and best bearers of the finest fruits do so uniformally from year to year. Mr. Shamel, circulars No. 77, Bureau of Plant Industry, Washington, D. C., which circular all up-to-date orchardists should read, referring to breeding up fruit, also says:

referring to breeding up fruit, also says:

"To every prospective planter of citrus trees the reliability and character of trees planted are of paramount importance. The expense for buds is a comparatively small item in the planting of a grove, not in any sense commensurate with their importance to the planter. It is probable that the additional expense necessary for the production of selected stock will be gladly borne by the planter provided he is assured of its improved value.

For example, the prefermance record of his breeding selection account as well as the performance record of his breeding selection.

Therefore observe particularly the next two numbers.

3. For their general nursery propagation they eliminate all trees not among the best, placing permanent labels only on the best, all points being considered. 1911 stock of this class is limited.

4. By cooperation on a commercial basis with the orchardist this Nursery selects the maximum producer of these best labeled trees, and from such trees, which are specially labeled and platted. they grow trees of the very highest type, "Pedigreed," but as yet in very limited quantities.

The Y-S Nursery stands for all the above. It is correct that their position is questioned by a very few, but practically all up-to-date growers of trees and fruit agree on all these points. Any inquiry along these or any other lines will be cheerfully answered from the office at Sunnyside, Wash. Signed: W. S. McCLAIN H. M. LICHTY
